ENTERPRISE LEADERS EVALUATING MSSP

November 12, 2026

12:00 PM-6:00 PM

Pacific Time

The rapid acceleration of generative and agentic AI is fundamentally reshaping the enterprise threat landscape. As adversaries deploy automated tooling to compress attack lifecycles from days to minutes, traditional security operations models are being stretched beyond capacity. For technology and security executives, staying ahead requires more than incremental automation—it demands an architectural shift toward human-led agentic, intelligence-driven defense.

Join an exclusive group of senior technology and security leaders for a strategic, half-day executive forum exploring the vanguard of modern cyber defense. This session convenes industry peers, Google Cloud security leadership, and specialized Managed Security Service Providers (MSSPs) to examine how agentic security operations transform threat intelligence into decisive, agentic action.

Key Discussion Areas:

Navigating the AI Threat Landscape: Deconstructing modern attacker tactics and addressing the asymmetry created by machine-speed threats.

The Agentic Paradigm Shift: Understanding how agentic AI agents augment human analysts, streamline triage, and achieve sub-second incident containment.

Operationalizing Partner Capabilities: Real-world peer case studies from certified Google Cloud Agentic MSSPs demonstrating measurable reductions in Mean Time to Respond (MTTR) and operational overhead.

Interactive Strategy & Technical Pods: Collaborative roundtables and dedicated demo pods to explore tailored integration patterns and executive risk mitigation frameworks.
